

Method and device for hydrogen generation

Generation of Hydrogen by laser irradiation of Graphene in alcohols, water and their vapors in scalable broadband photocatalytic reactor (UV-VIS-IR) for Renewable Energy Applications

INVENTION

The efficient generation of hydrogen occurred by using graphene as a photocatalyst. Invention demonstrated that Laser Induced White Emission (LIWE) on Graphene in water or other liquids (as source fuels) is applicable as a new method for hydrogen production. This emission resulted from the multiphoton ionization of graphene. The multiphoton ionization is assisted by the emission of hot electrons and precedes the broadband luminescence combined with the (sp²,sp³)→(sp³,sp²) hybrid transition [Stręk et al, Int. Journal of Hydrogen Energy 47, 63, 2022].

Research

LIGHT H₂ generation

Light Boosted Electrolysis

H₂ generation from water

Catalysis References

Laser H₂ generation from vapors

Applications

Hybrid LIGHT Photocatalysis

Aerospace

Light-Driven Propulsion

Hydrogen generation by light irradiation of graphene aerogel in water, ammonia water and methanol. Converting light energy into thermal energy using graphene-based photolysis with hydrogen storage. Photonic Devices Microchip for hydrogen distributed systems based on graphene nanocatalysts.

INNOVATIONS

Graphene Hydrogen Cartridge

Bank of Hydrogen Microchips

Pulse Jet Hydrogen LIGHT Motor

ADVANTAGES

The Graphene LIGHT Technology Main Advantages

1. Laser Induced Light on Graphene makes a high efficiency Synergetic Process for Hydrogen Evolution. Hydrogen Production Efficiency **~17kWh/kg H₂**
2. Highest available hydrogen generation ratio using Photocatalysis electrode-less Graphene Hydrogen Removables Cartridges.
3. Photolysis directly from water using Graphene.
4. Cost-effective solution based on **CW laser** diodes array as energy sources.
5. Security issue - light source isolated from electrical power supply.
6. Mobile stand - small size of the LIGHT unit.
7. Patent application **UP P.436197**
